Kohn-Sham density functional theory

$$H^{\text{KS}}[\rho]\phi_i = \epsilon_i\phi_i$$

$$\rho = \sum_i f_i |\phi_i|^2$$

*A non-linear eigenvalue problem: how to solve?*

Background

Method Development

Construct Kohn-Sham Hamiltonian  $H^{\text{KS}}[\rho^{\text{in}}]$  for some input particle density  $\rho^{\text{in}}$

Find the eigenfunctions  $\{\phi_i\}$  and use to construct an output particle density  $\rho^{\text{out}} = \sum_i f_i |\phi_i|^2$ .

Is  $\rho^{\text{in}} = \rho^{\text{out}}$ ? If so,  $\rho$  is *self-consistent*, and we have a solution to Kohn-Sham DFT.

Contents

Background

Method Development

But what if  $\rho^{\text{in}} \neq \rho^{\text{out}}$ ?

Define an iterative algorithm that gets us to  $\rho^{\text{in}} = \rho^{\text{out}}$  starting from an initial guess  $\rho^{\text{guess}}$

Background

Method  
Development

'Ease of convergence' to a self-consistent solution depends on heavily on the input system

- Bulk Al – easy
- Transition metal oxide surface – not so easy

Method  
Development

## Goals:

- 1) Identify and analyse all sources of divergence in Kohn-Sham DFT
- 2) Construct a representative 'test suite' for methodological development
- 3) Formalise/propose analysis tools that allow one to discern whether method X is 'better' than method Y

# Good Practices in Methods Development

Background

Method  
Development

So, we have examined all sources of divergence, and constructed a representative test suite, what now?

Run a sample of existing methods (contemporary, historically relevant, etc.) through the test suite and analyse the output.

Development

Analysis: what makes these methods 'good'?

**Def:** Robust. Percentage of test suite converged.

**Def:** Efficiency. Quantify the speed of convergence for systems that *do* converge.

## Robustness vs. efficiency: *Pareto analysis*

Choose a 'Pareto optimal' method

# Good Practices in Methods Development

Self-Consistency in Density Functional Theory

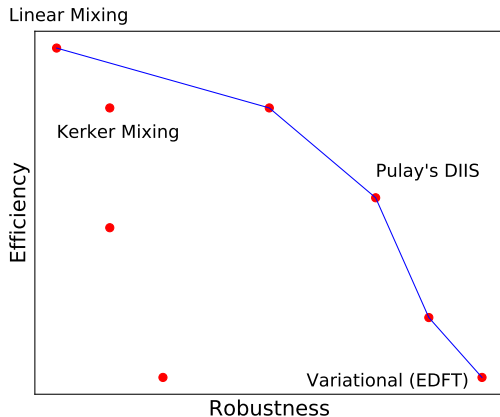

Nick Woods

Contents

Background

Method Development

A DFT developer should choose a method on the Pareto front.

Method  
Development

**Q:** If I create a method, how will I know if it lies on the Pareto front without rerunning all analysis?

# Good Practices in Methods Development

Self-Consistency in Density Functional Theory

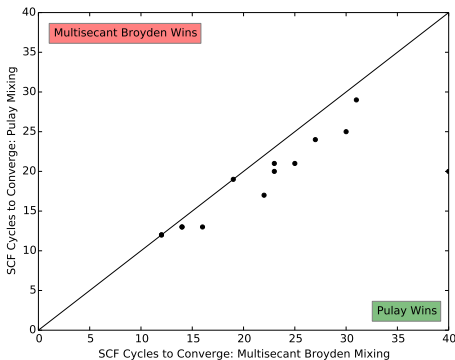

Nick Woods

Contents

Background

Method Development

**A:** Take a 'similar' method that lies on the Pareto front, and compare

Can identify particular strengths and weaknesses, etc.

# Good Practices in Methods Development

Background

Method  
Development

In summary:

- Creates a well-motivated, standard benchmark
- Provides tools to systematically compare methods
- Increases transparency and creates a better practice for both DFT developers, and method developers
